

**A TAXONOMIC LISTING  
MACRO- and MEGAINVERTEBRATES**

from  
Infaunal & Epibenthic Monitoring Programs in the Southern California Bight

EDITION 5

**21 July 2008**

Prepared by  
The Southern California Association of Marine Invertebrate Taxonomists  
Natural History Museum of Los Angeles County Research & Collections  
900 Exposition Boulevard Los Angeles, CA 90007

The editors of this list intend that it undergo regular updates. SCAMIT hopes to maintain the list as a useful document to those involved with monitoring programs within the Southern California Bight. To this end we solicit the users' assistance. Please forward any comments, corrections, or suggested additions you may have to:

### **A TAXONOMIC LISTING OF BENTHIC MACRO- and MEGAINVERTEBRATES**

from  
Infaunal and Epifaunal Monitoring and Research Programs in the Southern California Bight

Prepared by  
The Southern California Association of Marine Invertebrate Taxonomists  
Donald B. Cadien and Lawrence L. Lovell, editors

#### **EDITION 5**

Taxonomic standardization, assuring that the same name is applied to an organism by different taxonomists each time that organism is encountered, is an important quality control concern in any biological monitoring program. Compatibility of taxonomy-based data generated by agencies and organizations contributing to a regional monitoring program is essential if the full value of these surveys is to be realized. There are two obstacles to achieving the goal of standardization: the complexity and fluidity of invertebrate taxonomy; and the differences in expertise, experience, and opinion of taxonomists involved in monitoring within the region. While these obstacles hinder us from fully achieving this goal, a great deal can be accomplished in its pursuit. Central to that effort is regional cooperation and communication among the taxonomists responsible for the surveys.

The Southern California Association of Marine Invertebrate Taxonomists (SCAMIT) was formed in 1982 to promote the study of invertebrate taxonomy and develop a standardized taxonomy of marine invertebrates within the region. Its membership includes most of the taxonomists responsible for conducting infaunal and epifaunal monitoring programs in Southern California coastal waters. SCAMIT's activities include monthly meetings, workshops, and communication of taxonomic information to its membership through a newsletter and internet website.

This list of invertebrates from benthic habitats of the Southern California Bight (SCB) is a contribution of SCAMIT toward the development of regionally coordinated monitoring within the Bight. This edition updates Edition 4 released 6 October 2001, and continues SCAMIT's efforts to compile and maintain a list of species for which taxonomy is standard within the region. That is, a list of species names that are uniformly and consistently applied to organisms by taxonomists conducting research and monitoring programs in the Bight. Like earlier editions, this is a conservative document constrained by both the information base from which it is derived and by the criteria for including a taxon on the list. The fifth edition expands upon the previous edition by the addition of organisms encountered in infaunal and epifaunal surveys conducted subsequent to the compilation of Edition 4 and incorporation of nomenclatural changes prompted by recent revisionary systematic studies. Notably, this edition incorporates species reported from the 2003 Southern California Bight Regional Monitoring Program (Bight'03), which included benthic

samples to depths of 1000m in nearshore basins, and megainvertebrates from trawls to depths of 500m in the Bight. This continues to expand the coverage of habitats within the Bight by considerably extending the bathymetric limits of included taxa. Additional deeper water records were provided by the Baseline Study conducted in 2003 by LACSD, and by the Variability Study performed in 2005-2006 by CSDMWWD. The number of observations in this deeper portion of the covered area is still small compared to those on the continental shelf.

Caution is required in the use of this or any other "master species" list. Taxonomic listings do not in themselves constitute standardization of taxonomic usage. They are only tools that contribute to standardization, both as a product and in the process of their development and maintenance. Those responsible for developing regional monitoring should not attempt to impose on contributing surveys an artificially rigid taxonomy based upon a static list of standard names. Such an approach would inevitably lead to poorer quality survey data. Some differences in taxonomy and nomenclatural usage will continue to appear in data sets originating from contributing surveys. Most of these will reflect either change in the species encountered or new revisionary work. Some will represent non-standard usage despite efforts such as this listing and the activities of SCAMIT. Regional data-management systems must allow both growth and emendation to their species lists allowing them to conform to current usage. Ranasinghe *et al* (2003b) evaluated the success of quality assurance taxonomic standardization in the second regional monitoring survey (B'98) and provided some idea of both the value of the contributions to standardization made to date and the magnitude of the unresolved issues.

## COVERAGE OF EDITION 5

This document provides a list of macroinvertebrates and megainvertebrates from both soft and hard bottom habitats of the Southern California Bight. For the purposes of the list, macroinvertebrates are defined as those organisms retained upon a 0.3 mm or larger mesh screen. Epibenthic megainvertebrates are defined as benthic organisms captured in otter trawls and having a body dimension greater than 1 cm. The list draws from sampling programs that have been in existence since as early as 1970 (see table of contributors). Over that period, sampling frequencies and station locations have varied but gear types and methods have been stable. The list reflects the organisms collected from thousands of samples within the habitats covered. The majority of the records are from soft substrate on the inner to mid shelf within the SCB, but increasingly information from other habitats from the intertidal to the nearshore basins is also represented. There are 2,551 species-level taxa on the list representing 18 phyla, 37 classes, 111 orders, and 586 families.

Geographic coverage is from Point Conception, California to Bahía Todos Santos, Baja California Sur, Mexico in depths to 1000 meters (see chart). As in previous editions, the information base from which the list is derived is primarily survey data collected in the environmental monitoring programs of publicly owned

### Contributing Programs

#### LARGE DISCHARGE MONITORING PROGRAMS

- City of Los Angeles, Bureau of Sanitation, Environmental Monitoring Division
- County Sanitation Districts of Los Angeles County
- Orange County Sanitation District
- City of San Diego, Metropolitan Wastewater Department

#### SMALL DISCHARGE MONITORING PROGRAMS

- Goleta Sanitary District
- City of Santa Barbara
- Carpinteria Sanitary District
- City of Oxnard
- South East Regional Reclamation Authority
- City of Oceanside
- Encina Water Pollution Control Facility
- San Elijo Joint Powers Authority
- City of Avalon
- Int'l Treatment Plant, South Bay Outfall

#### MISCELLANEOUS STUDIES

- Terminal Island Treatment Plant Outfall Study
- Tijuana Ocean Engineering Study
- LACSD Reference Survey
- CSDMWWD Variability Study

#### REGIONAL SURVEYS

- Southern California Coastal Water Research Project Reference Surveys
- 1994 Southern California Bight Pilot Project (SCBPP)
- Southern California Bight 1998 Regional Monitoring Project (Bight'98)
- Southern California Bight 2003 Regional Monitoring Project studies (Bight'03)

wastewater treatment works (POTWs). Therefore, coverage within the Bight is biased by the distribution of sampling efforts associated with these programs. The largest of these are centered on the metropolitan areas of Los Angeles/Orange County and San Diego. The fauna occurring at shelf and upper slope depths in these areas is well represented. North of the Los Angeles region, monitoring programs are fewer in number and smaller in scale. Consequently, the fauna from the northern area of the Bight is under-represented. Records from Regional Monitoring Surveys (Allen *et al.* 1998, 2002, 2007; Bergen *et al.* 1998; Ranasinghe *et al.* 2003a, 2007) improve coverage in this northern region as well as those portions of the shelf lying between the individual POTW monitoring areas. Coverage is poorer south of the US/Mexico border where the only records come from recent monitoring of the International Treatment Plant's South Bay Outfall (south to Punta Banderas) and the Mexican component of the Bight'98 Regional Survey (south to Bahía Todos Santos). Edition 5 also includes Bight'98 and Bight '03 records from bays and harbors and from six of the eight Channel Islands (San Nicholas Island and San Clemente Island were not sampled). However, a limited number of samples were collected within these habitats.

Most sampling effort has been expended at mid shelf depths of 40 to 80 meters and the fauna from this range is better represented than that of shallower or deeper waters. More information on slope and basin habitats is becoming available, but depths between 300 and 1000m are still poorly represented in the Edition 5 list. It should also be noted that while all the source programs are designed to provide soft-bottom community monitoring, habitats are not so clearly segregated in nature. Many of the sampling programs, particularly those sampling either the inshore soft-bottom or shelf-break zone, include ecotonal areas and patches of cobble or hard bottom. These support communities significantly different from those of soft-bottoms, accounting for the presence of hard-bottom taxa on the list. Beginning with this edition, records from fouling and both rocky and soft intertidal will start appearing. Coverage will be far less comprehensive for these habitats initially, but in future editions will approach that of central shelf habitats. These records will derive from a broad spectrum of sampling efforts. Many cooperative programs are underway by state, federal, and other agencies which sample embayments or open coastal intertidal and shallow subtidal habitats. These are usually focused on the detection and enumeration of introduced species. Other efforts designed to quantify effects of anthropogenic contaminants and other human usages in bays, harbors and estuaries are also continuing. These include the long series of EMAP programs along the entire west coast of North America, sampling to develop sediment quality objectives, and other efforts. Only records from within the covered geographic portion of these broad scale programs will be included in this listing. Only those records either generated by or subsequently reviewed by SCAMIT member taxonomists or SCAMIT associated taxonomists will be admissible. The requirement that use of the included taxon name be standardized within the region is in force here as well.

## **PROCESS OF COMPILATION**

Because all subsequent editions build on the original, the description of the information sources and compilation process used in producing Edition 1 (March, 1994) is restated below.

The base list was compiled from encountered-species lists from the infaunal monitoring programs of the Bureau of Sanitation, Environmental Monitoring Division, City of Los Angeles (CLA,EMD); the County Sanitation Districts of Los Angeles County (CSDLAC); the County Sanitation Districts of Orange County (CSDOC); and the Metropolitan Wastewater Department, City of San Diego (CSD,MWD). The encountered-species lists provided by these agencies covered a range of time spans, from eight to more than 20 years. The base list was broken into phylogenetic groupings (phylum or class level) for review by SCAMIT members with expertise in each group and knowledge of the history of the programs from which the data were derived. This latter factor is important given the long

term nature of the programs from which the list was derived. These programs have been in place since as early as 1972. There is substantial potential for confusion of species identities because of the many taxonomists involved over the period. Every species name on the base list was subject to review and discussion prior to acceptance on the final list. Names retained were those 1) found to have been applied to taxa recognized as unique and 2) for which consensus among SCAMIT reviewers existed as to the name used to represent these taxa. Consensus here does not imply unanimity of opinion, but an agreement to accept a standard use of a name in the interest of regional conformity. Conflicts of opinion were resolved by review of appropriate literature and, in many cases, re-examination of voucher specimens by the reviewers.

Following compilation of the list from the four largest programs, encountered-species lists from monitoring programs conducted by the smaller POTWs in the Bight and studies by the Southern California Coastal Water Research Project (SCCWRP) were reviewed. This latter stage was hindered by the general absence in the smaller monitoring programs of easily accessible databases from which to draw encountered-species lists, frequent changes in contractors performing the sample analysis, and the unavailability of the taxonomists responsible for the data. The encountered-species lists received were typically from the most recent surveys, although the actual time spans were not given. Approximately 10% of the species on the final list were added as a result of review of the small POTW encountered-species lists.

The process of compilation resulted in a list, which is generally exclusive in nature. Many taxa names reported in the contributed species lists were eliminated by the reviewers, frequently because of the absence of voucher specimens or documentation allowing their confirmation. Inevitably, some taxa names eliminated will later be found acceptable. In addition, voucher specimens were not examined in all cases and some taxa deemed uncontroversial may later be discovered to be inconsistent in application or otherwise unacceptable. It is anticipated that this list will grow and change during future updates.

The first edition drew upon the encountered-species lists of 16 infaunal monitoring programs in the region. Subsequent editions built upon the first through a similar process of addition and emendation. In each edition newly detected taxa were added, nomenclatural revisions were incorporated, and errors in the previous edition corrected. Previously listed names found to be based upon doubtful or unverifiable records were dropped from the list. Provisional species names lacking adequate characterization or uniformity of application within the region were also dropped.

The second edition included, for the first time, epibenthic invertebrates taken in trawl surveys within the Bight as well as new records from the surveys conducted as part of the 1994 Southern California Bight Pilot Project. This regional project included surveys of mainland coastal soft-bottom infaunal and epibenthic communities from Pt. Conception to the US/Mexico border, employing the same techniques used in POTW monitoring programs.

The third edition was enlarged by the inclusion of abbreviated synonymies. These presented both nomenclaturally valid synonyms and synonyms based upon usage. They were not exhaustive, but rather sought to provide examples of the various combinations under which a name has occurred with an emphasis on usage in the Southern California Bight and the northeast Pacific. An explanation of the notation employed in synonymies is provided below.

The fourth edition continued to grow in coverage by accretion. Abbreviated synonymies were continued, and in some cases enlarged as more information became available. The range of habitats examined expanded by inclusion of the results of the second regional survey (Bight '98), which

added a number of additional samples from bays, estuaries, offshore island shelves, and northwestern Baja California.

## CONVENTIONS

Arrangement of the list is hierarchical. The categories used are phylum, subphylum, class, subclass, infraclass, superorder, order, suborder, infraorder, superfamily, family, subfamily, genus (subgenus) and species. For ease of use each taxonomic category is offset from the next higher category. Each category above genus is, moreover, indicated directly by inclusion with the taxon name itself to avoid ambiguity (*e.g.*, Subphylum Echinozoa). Arrangement of families is phylogenetic when information is available, and alphabetic otherwise. Genera, and species within them, are arranged alphabetically within each family or subfamily, as appropriate. Authorship is attributed in conformance with ICZN rules. The listing of genus-level identifications (*e.g.*, *Bimera* sp) represents the degree to which the identities of these taxa are known in the region. This form is also used in cases where the only specimens representing the genus were indeterminable due to absence of diagnostic characters. It is regional practice in monitoring programs to identify some groups of organisms at family or higher level. An example is harpacticoid copepods, which are reported at the ordinal level. For these taxa the term **unidentified** appears in the binomen position. The level at which they are typically reported is indicated by the lowest level taxon provided in the hierarchy.

The degree of detail in the use of higher taxonomic categories varies between groups. In groups where there are both large numbers of species and wide variations in form, numerous categories are listed between the phylum and genus level (arthropods, for example). In poorly represented groups with few species (*e.g.*, cephalochordates) there may be few categories listed between phylum and family.

To assist in navigation the list is line-numbered and an index to all names in the list (including synonyms) with their corresponding line numbers is provided. Within the list the following typographic conventions have been employed:

### PHYLUM LEVEL IS ALL CAPS

#### **Family and Subfamily levels are bolded**

*Genus and species are in italics*

Synonyms are indented below currently accepted binomens and not italicized

Included in the list are a number of unpublished provisional species names erected by workers in the area. These names are applied to organisms suspected of being new species or whose identities cannot be determined from available literature. Provisional names are typically in the form of a genus name followed by the word **species** (abbreviated as **sp**) and an alphabetic, alphanumeric, or numeric designator. In provisional binomens, the generic level name is italicized, while the specific name is not. Synonyms are left unitalicized to help clarify their status. In cases where the allocation of a taxon is uncertain, the levels at which uncertainty exists are indicated (*e.g.*, family uncertain, suborder uncertain, *etc.*). Ideally, a provisional name is provided as a temporary designation pending resolution of the organism's identity through further research or publication. In practice, many have become long standing, stable, and widely recognized taxa names within the region. Of the 273 unpublished provisional taxa included in Edition 5, some date back to the 1970's. Many of the provisional taxa recognized by SCAMIT member taxonomists have now been described either by the members themselves or by other taxonomists. You will find them on this list as synonyms of the formally described taxa. All listed provisionals have been subject to examination and their descriptions distributed through the activities of SCAMIT (1982 to present) or its antecedent, the

SCCWRP Taxonomic Standardization Program (1973-1980). For these reasons, as well as the significant proportion (11.4 %) of the listed taxa they represent, these provisional species names are included in the list. The unpublished provisional names are distinguished from formally erected species and provisional names published in the literature by the symbol § following the author. Authorship is attributed for provisional names to tie them to specific diagnoses. Attribution of authorship of these unpublished names does not follow a rule of priority, but attempts to indicate the most recent and/or complete source of information regarding the species. The date provided represents the date of distribution of diagnoses or descriptions. Provisional species names for which there is no regional recognition or available diagnoses are not included. These are numerous, and usually become provisional names whose usage is regionally standardized as voucher sheets on them are distributed.

Three conditional designations are used in the list. The terms *conferre* and **near** (abbreviated as *cf* and **nr**) inserted in the binomen indicates that the organism closely resembles the nominal species but its actual identity is in question. The term **Cmplx** appended to a name indicates that the listed taxon is recognized as having a high degree of poorly defined variability and may belong to an incompletely discriminated group of species.

The first entry in the synonymy is the name as originally described if it differs from that listed as currently used. Otherwise entries are in alphabetical order. The form in which authorship is provided is used to distinguish the nature of the entries. Examples of the forms used and their meaning are provided below.

Schmitt 1921	Synonym
Schmitt 1921 in part of Holmes 1900	Partial synonymy
of Schmitt 1921 not Blazor 1899	Variant generic placement or variant orthography
of authors not Bates 1885	Specific instance of incorrect usage
of authors SCB not Baird 1863	Incorrect usage by several authors
	Incorrect usage regionally by several authors

Usage cited as “of authors” is not restricted to usage in the literature, but also includes usage in survey results and reports. The acronyms NEP and SCB stand for northeast Pacific and Southern California Bight respectively.

Each new edition in the past has had name changes and new entries from the previous edition. These modifications were never listed or noted, making them hard to find for taxonomists and database managers who were concerned with updating species lists. This edition of the list presents a new feature to draw attention to the numerous changes. All changes from Ed 4 are noted in red colored font. This will make the job of finding and noting all the changes much easier. Rules were established for red color fonting. The rules highlight the changes to Ed 4 that taxonomists and database managers should be aware of when reporting binomens, authors, or hierarchical position of taxa.

- 1) New name not in Ed 4 (upper hierarchical addition, new species addition either as valid name or synonym).
- 2) Change in status of synonym, elevation to valid name.
- 3) Change in status of valid name, placed in synonymy.
- 4) Spelling correction, red fonting the changed name either genus or species (not the entire binomen) or author.
- 5) Correction to authorship attribution.
- 6) Change in assigned genus.

## AUTHORITY LIST FOR TAXONOMIC INFORMATION

A broad range of sources was used in construction of this hierarchical listing of organisms. The overall basis is that embodied in *An Annotated Checklist of Marine Invertebrates in the Cold Temperate Northeast Pacific* (Austin 1985). This classification has been superseded in a number of areas by investigations over the past quarter century which aimed to put animal classification on a more phylogenetic basis. These investigations initially used cladistic methods to reassess relationships based on morphological characters. More recent contributions typically utilize molecular data based on sequencing of DNA or protein coding genes. Use of the weight of evidence approach, which combines molecular, morphological, paleontological, and developmental lines of evidence has become increasingly common. These investigations are ongoing, and much uncertainty remains for many groups. A recent synthesis (Cracraft and Donoghue 2004), while still imperfect, can serve as a consensus base for updating the hierarchical relationships used by Austin. Where groups have been revised at higher level based on phylogenetic information in Cracraft and Donoghue, it is so indicated under each group below.

The formation of superfamily names follows recommendation 29A of the *International Code of Zoological Nomenclature* (Ride 1999). With this exception and those listed below, all of the classification above genus-level is derived from Austin (*op. cit.*). Genus-level taxa names and the distribution of species among genera are derived from multiple sources in the recent literature.

### Phylum Porifera

This taxon was found to be paraphyletic, and has been separated into two phyla Silicea and Calcarea (see Eernisse & Peterson 2004). In their taxonomic reassessment of the sponges Hooper & van Soest (2002) discussed, but did not adopt this conclusion. It is followed here. Silicea consists of Demospongia and Hexactinellida, while Calcarea consists of the calcareous sponges only. Organization within the sponges below phylum level follows Hooper and van Soest, although level of nominal categories may be changed in conformance with the adoption of the two phylum system.

### Phylum Cnidaria

Modifications follow Cairns *et al.* 2002 unless otherwise indicated

Placement of Oplorhiza in Campanulinidae follows Hochberg & Ljubenkov 1998

Placement of species not recorded by Austin follows Ljubenkov 1980.

### Phylum Platyhelminthes

Developments in the understanding of this group have been numerous and far-reaching.

The traditional phylum Platyhelminthes as used by Austin has been modified to exclude the Acoela, which with the Nemertodermatida form the Acelomorpha, now considered the sister taxon to all other bilaterians (see Eernisse & Peterson 2004, Littlewood *et al.* 2004). No acoels have yet been taken by surveys within the SCB, and so this change is not reflected in the listing. Other high-level changes within this phylum do require some modifications of the hierarchy as used in Austin, but are also only needed for forms not yet reported on the list. The classification of the Polycladida generally follows Faubel 1983 and 1984, with some input from Prudhoe 1985.

### Phylum Nemertea

Treatment of Cerebratulidae as Cerebratulinae within Lineidae follows MacEwen 1980.

## Phylum Mollusca

The Class Aplousobranchia as used by Austin has been suggested to be paraphyletic (see Salvini-Plawen & Steiner 1996, Haszprunar 2000), although there is still not complete agreement on the issue (see Scheltema 1996 for a dissenting opinion). The paraphyly seems clear, although just how the Solenogastres and Caudofoveata are related to the Polyplacophora is not (see discussions in Lindberg *et al.* 2004, Salvini-Plawen 2003). The use of the subphyla Adenopoda and Scutopoda follows the recommendations of Barwick & Cadien 2005.

Year of publication for taxa erected by P. P. Carpenter between 1864 and 1866 follows Palmer 1958.

General classification of the Gastropoda, and most specifics as well, follows Bouchet & Rocroi 2005 (with Linnaean categories assigned to their clades).

Nomenclature embodied in McLean 2007 were incorporated.

Elevation of Cysticinae to family rank follows Covert & Covert 1995.

Allocation of genera to families within the Superfamily Conoidea follows Taylor *et al.* 1993.

Allocation of heterobranch taxa at suprageneric levels follows Mikkelsen 1996.

Placement of *Iselica* in Amathinidae follows Turgeon *et al.* 1998.

Use of Stiligeridae instead of Hermaeidae follows Turgeon *et al.* 1998.

Placement of *Olea* in Stiligeridae follows Turgeon *et al.* 1998.

Use of Cylichnidae instead of Scaphandridae follows Turgeon *et al.* 1998.

Placement of *Pleurobranchaea* in Pleurobranchaeidae follows Behrens 2004.

Within the Order Nudibranchia superfamily-level taxa are from Abbott 1974; allocation of genera among families follows Behrens 2004.

Classification of the Bivalvia follows Coan, Valentich Scott & Bernard 2000.

Genus and family allocations in Scaphopoda follow Shimek 1995; groups not covered in Shimek follow Turgeon *et al.* 1998.

Formulation of higher taxon names within cephalopods follows Sweeney & Roper 2000

## Phylum Sipuncula

Classification follows Cutler 1994, except that Golfingiiformes rather than Golfingiiformes is used following Edmonds 2000b. The validity of this morphologically derived system was reinforced by recent combined evidence (morphological/mollecular) analysis (Schulze *et al.* 2007).

## Phylum Echiura

Class Echiuridea is used rather than Class Echiurida following Edmonds 2000a.

(While recent evidence suggests this group nests within the Polychaeta, it has been retained separate here pending resolution of affinities within that group. The polychaete subclade that best accommodates the echiurans remains at issue.)

## Phylum Annelida

Classification of the Class Polychaeta follows Rouse & Fauchald 1997 and Rouse & Pleijel 2001.

Placement of *Raricirrus* in Ctenodrilidae, Order Ctenodrilida follows Petersen & George 1991.

Use of Longosomatidae instead of Heterospionidae follows Borowski 1995.

Use of Acoetidae instead of Polyodontidae follows Pettibone 1989.

Use of Pholoidae instead of Pholoididae follows Pettibone 1984.

Placement of *Pholoe* in Pholoidae follows Pettibone 1992.

Nomenclature within the Glyceridae follows the revision of Böggemann 2002

Nomenclature within the Goniadidae follows the revision of Böggemann 2005.  
Use of Pilargidae instead of Pilargiidae follows Licher 1994.  
Use of Nereididae instead of Nereidae follows Pettibone 1971.  
Uncertainty of familial placement of *Hesionella* and *Microphthalmus* (formerly in Hesionidae) follows Pleijel & Dahlgren 1998.  
Use of Oeonidae instead of Arabellidae follows Orensanz 1990.  
Placement of Artacamella in Trichobranchidae follows Holthe 1977  
Inclusion of the Siboglinidae in the Sabellida follows Rouse & Pleijel 2001.  
Arrangements of subfamily assignments within the Polychaeta follow:  
    Ampharetidae - Fauchald 1977  
    Maldanidae – Fauchald 1977  
    Nereididae – Fitzhugh 1987  
    Phyllodocidae – Pleijel 1991  
    Polynoidae – Salazar-Silva 2006  
    Sabellariidae – Kirtley 1994  
    Sabellidae – Fitzhugh 1989  
    Serpulidae – Fitzhugh 1989  
    Syllidae – Fauchald 1977  
    Terebellidae – Fauchald 1977

#### Phylum Arthropoda

Subphylum taxa are from Brusca & Brusca 2003.

    Within Subphylum Crustacea the revised classification of Martin & Davis 2001 (with some emendation from McLaughlin *et al.* 2005) is adopted.

    Mysid subfamily arrangement follows the cladistic analysis of Meland & Willassen 2007

    Ordering of the family taxa within Amphipoda follows Bousfield & Shih 1994 and

    Bousfield 2001, and adopts his infraordinal and superfamily concepts in most cases

    Allocations of taxa and systematic arrangement within superfamilies of amphipod follow:

        Corophioidea – Myers & Lowry 2003

        Lysianassoidea – Cadien 2007

        Stegocephaloidea – Berge & Vader 2001

        Talitroidea – Serejo 2004

    Family allocations in the Tanaidacea were modified following Larson & Wilson 2002

    Within the decapod infraorder Anomura the hierarchy of Martin & Davis was modified based on the cladistic analysis of McLaughlin *et al.* 2007

    Superfamily and family placement of *Pilumnoides* is based on Karasawa & Schweitzer 2006

#### Phylum Echinodermata

    All differences in classification above family are from Maluf 1988.

#### Phylum Phorona

    No exceptions

#### Phylum Brachiopoda

    Placement of *Terebratalia* in Dallinidae follows Hochberg 1996.

#### Phylum Ectoprocta

    Use of Annectocymidae instead of Diaperoeciidae follows Soule *et al.* 1995.

    Use of Candidae instead of Scrupocellariidae follows Soule *et al.* 1995.

    Placement of *Cauloramphus* in Calloporidae follows Soule *et al.* 1995.

Placement of *Celleporaria* in Celloporariidae follows Soule *et al.* 1995.

Phylum Chordata  
No exception

## ACKNOWLEDGEMENTS

The editors would like to thank the large number of SCAMIT members who have devoted their time to the origination and maintenance of the taxonomic listing. Comments from non-SCAMIT members have also been received, and are always welcome. The application of many sets of eyes to this list has helped eliminate many errors during its development. While Edition 5, like previous ones, will undoubtedly have errors, these are the responsibility of the editors alone.
