EDITION 14

Taxonomic standardization, assuring that the same name is applied to an organism by different taxonomists each time that organism is encountered, is an important quality assurance concern in any biological monitoring program. Compatibility of taxonomic data generated by agencies and organizations contributing to regional monitoring programs is essential if the full value of these surveys is to be realized. There are two obstacles to achieving the goal of standardization: the complexity and fluidity of invertebrate taxonomy, and the differences in expertise, experience, and opinion of taxonomists involved in monitoring within the region. While these obstacles hinder us from achieving uniformity, a great deal can be accomplished in its pursuit. Central to that effort is regional cooperation and communication among the taxonomists responsible for the surveys.

The Southern California Association of Marine Invertebrate Taxonomists (SCAMIT) was formed in 1982 to promote the study of invertebrate taxonomy and develop a standardized taxonomy of marine invertebrates within the region. Its membership includes most of the taxonomists responsible for conducting infaunal and epifaunal monitoring programs in Southern California coastal waters. SCAMIT's activities include monthly meetings, workshops, and communication of taxonomic information to its membership through a newsletter and website (www.scamit.org).

This list of invertebrates from benthic habitats of the Southern California Bight (SCB) is a contribution of SCAMIT toward the development of regionally coordinated monitoring within the Bight. This edition updates Edition 13 of July 1, 2021 and continues SCAMIT's efforts to compile and maintain a list of species for which taxonomy is believed standard within the region. That is, a list of species names that are uniformly and consistently applied to organisms in research and monitoring programs within the region. Like earlier editions, this is a conservative document constrained by both the information base from which it is derived and by the criteria for inclusion of taxa on the list.

Caution is required in the use of this or any other "master" species list. Taxonomic listings do not in themselves constitute standardization of taxonomic usage. They are only tools that contribute to standardization, both as a product and in the process of their development and maintenance. Those responsible for developing regional monitoring should not attempt to impose on contributing surveys an artificially rigid taxonomy based upon a static list of standard names. Such an approach would inevitably

lead to poorer quality survey data. Some differences in taxonomy and nomenclatural usage will continue to appear in data sets originating from contributing surveys. Most of these will reflect either change in the species encountered or new revisionary work. Some will represent non-standard usage despite efforts such as this listing and other activities of SCAMIT. Regional data management systems must allow both growth and emendation to their species lists to conform to current usage. Ranasinghe *et al.* (2003b) evaluated the success of quality assurance taxonomic standardization in the second regional monitoring survey, Bight'98 (B'98), and provided some idea of both the value of the contributions to standardization made to date and the magnitude of the unresolved issues.

Edition 7 was the first edition available only on-line. It was available in Portable Document Format (pdf), which is fully searchable. This renders the index provided in previous editions obsolete, and none is provided here. Edition 14 is another step in the evolution to a fully interactive on-line list in the future, where comments and questions regarding the list contents can be made by users in real-time. Future lists will be linked to other resources on the internet, providing additional information on the species covered. We have not yet accomplished this but look forward to doing so in the future.

COVERAGE OF EDITION 14

This document provides a list of macroinvertebrates and megainvertebrates from both soft and hard bottom habitats of the SCB. Holoplanktonic species are not included in the list. For the purposes of the list, macroinvertebrates are defined as those organisms retained upon a 0.3 mm or larger mesh screen. Megainvertebrates are defined as benthic organisms captured in otter trawls and having a body dimension greater than 1 cm. The list draws from sampling programs that have been in existence since as early as 1970 (see table of contributors). Over that period, sampling frequencies and station locations have varied but gear types and methods have been relatively stable. The list reflects organisms collected from thousands of samples within the habitats covered. Most records are from soft substrate on the inner to mid-shelf within the SCB, but information on other habitats from the intertidal to the nearshore basins are also represented. Records in the published literature are not sufficient for inclusion, only actual examined specimens form the basis for this listing. There are 3217 species-level taxa on the list representing 16 phyla, 41 classes, 148 orders, and 769 families.

Geographic coverage is from Point Conception, California, to Bahía Todos Santos, Baja California Sur, Mexico, in intertidal to 1000 m depths. As in previous editions, the information on which the list is based comes from survey data collected in monitoring programs of publicly owned treatment works (POTWs). Coverage within the SCB is biased by the distribution of sampling efforts associated with these programs. The largest of these are centered on the metropolitan areas of Los Angeles, Orange and San Diego counties. The fauna from shelf and upper slope depths in these areas is well represented. monitoring programs are fewer in number and smaller in scale. Consequently, the fauna of the northern SCB is underrepresented. Records from regional monitoring surveys in 1994, 1998, 2003, 2008, 2013 and 2018 (Allen *et al.* 1998, 2002, 2007, 2011; Bergen *et al.* 1998; Ranasinghe *et al.* 2003a, 2007, 2012; Gillett *et al.* 2017 & 2023, Walther *et al.* 2017) improved coverage in this northern region as well as between POTW monitoring areas. Coverage is poorer south of the US/Mexico border where the only records come from monitoring of the South Bay Ocean Outfall (south to Punta Banderas) and the Mexican component of the Bight'98 Regional Survey (south to Bahía Todos Santos). Records from estuaries, bays, and harbors taken in regional monitoring programs are included here. Salinities may be reduced in such enclosed habitats, but records from waters of less than 12 ppt salinity are excluded. This represents the midpoint of mesohaline water salinities, where euryhaline marine species reach their distributional endpoint, and estuarine endemics occur (Boesch 1977). Organisms from fresher oligohaline waters, those characterized as freshwater species, are not covered in this list.

Most sampling effort has been expended at mid-shelf depths of 40 to 80 m and the fauna from this range is better represented than that of shallower or deeper waters. More information on slope and basin habitats is becoming available, but depths between 300 and 1000 m are still underrepresented in this edition. Most source programs are restricted to subtidal, soft bottom monitoring, but records from both rocky and soft intertidal habitats and fouling have been included since Edition 6. Coverage will be far less comprehensive for these habitats initially, but in future editions will approach that of the central shelf. Records are derived from a broad spectrum of sources. Many cooperative programs are underway by state, federal, and other agencies which sample embayments or open coastal intertidal and shallow subtidal habitats. Records from Introduced Species Studies conducted within the SCB were included. Other efforts designed to quantify effects of anthropogenic contaminants and other human usages in bays, harbors, and estuaries are also continuing. These include the long series of Environmental Monitoring and Assessment Program (EMAP) programs projects along the entire west coast of North America, sampling to develop sediment quality objectives, and other efforts. Only records from within the covered geographic portion of these broad scale programs will be included in this listing. Only those records either generated by or subsequently reviewed by SCAMIT member taxonomists or SCAMIT associated taxonomists are admissible. The requirement that usage of the included taxon name be standardized within the region is in force here as well.

PROCESS OF COMPILED

Because all subsequent editions build on the original, the description of the information sources and compilation process which produced Edition 1 (March 1994) is restated below.

The base list was compiled from encountered-species lists from the infaunal monitoring programs of the Bureau of Sanitation, Environmental Monitoring Division, City of Los Angeles (CLA,EMD); the County Sanitation Districts of Los Angeles County (CSDLAC); the County Sanitation Districts of Orange County (CSDOC); and the Metropolitan Wastewater Department, City of San Diego (CSD,MWD). The encountered-species lists provided by these agencies covered a range of time spans, from eight to more than 20 years. The base list was broken into phylogenetic groupings (phylum or class level) for review by SCAMIT members with expertise in each group and knowledge of the history of the programs from which the data were derived. This latter factor is important given the long term nature of the programs from which the list was derived. These programs have been in place since as early as 1972. There is substantial potential for confusion of species identities because of the many taxonomists involved over the period. Every species name on the base list was subject to review and discussion prior to acceptance on the final list. Names retained were those 1) found to have been applied to taxa recognized as unique and 2) for which consensus among SCAMIT reviewers existed as to the name used to represent these taxa. Consensus here does not imply unanimity of opinion, but an agreement to accept a standard use of a name in the interest of regional conformity. Conflicts of opinion were resolved by review of appropriate literature and, in many cases, re-examination of voucher specimens by the reviewers.

Following compilation of the list from the four largest programs, encountered-species lists from monitoring programs conducted by the smaller POTWs in the Bight and studies by the Southern California Coastal Water Research Project (SCCWRP) were reviewed. This latter stage was hindered by the general absence in the

smaller monitoring programs of easily accessible databases from which to draw encountered-species lists, frequent changes in contractors performing the sample analysis, and the unavailability of the taxonomists responsible for the data. The encountered-species lists received were typically from the most recent surveys, although the actual time spans were not given. Approximately 10% of the species on the final list were added as a result of review of the small POTW encountered-species lists.

The process of compilation resulted in a list, which is generally exclusive in nature. Many taxa names reported in the contributed species lists were eliminated by the reviewers, frequently because of the absence of voucher specimens or documentation allowing their confirmation. Inevitably, some taxa names eliminated will later be found acceptable. In addition, voucher specimens were not examined in all cases and some taxa deemed uncontroversial may later be discovered to be inconsistent in application or otherwise unacceptable. It is anticipated that this list will grow and change during future updates.

The first edition (1994) drew upon the encountered species lists of 16 infaunal monitoring programs in the region. Subsequent editions built upon the first through a similar process of addition and emendation. In each edition newly detected taxa were added, nomenclatural revisions were incorporated, and errors in the previous edition corrected. Previously listed names found to be based upon doubtful or unverifiable records were dropped from the list. Provisional species names lacking adequate characterization or uniformity of application within the region were also dropped.

The second edition (1996) included, for the first time, epibenthic invertebrates taken in trawl surveys within the SCB as well as new records from the surveys conducted as part of the 1994 Southern California Bight Pilot Project. This regional project included surveys of coastal, soft bottom infaunal and epibenthic communities from Pt. Conception to the US/Mexico border, employing the same techniques used in POTW monitoring programs.

The third edition (1998) was enlarged by the inclusion of abbreviated synonymies. These presented both valid synonyms and synonyms based upon nomenclatural usage. They were not exhaustive, but rather sought to provide examples of the various combinations under which a name has occurred with an emphasis on usage in the SCB and the Northeast Pacific. An explanation of the notation employed in synonymies is provided below.

The fourth edition (2001) continued to grow in coverage by accretion. Abbreviated synonymies were enlarged as more information became available. The range of habitats examined expanded by inclusion of results of the second regional survey (B'98), which sampled bays, estuaries, offshore island shelves, and northwestern Baja California.

The fifth edition (2008) incorporated additional records from habitats little covered in previous editions, particularly the upper continental slope, bays, and harbors. It reflected many changes, particularly in the higher structure of the nomenclatural hierarchy, published in the last decade, even revising the number of phyla included in coverage. It reported additional taxa taken in the B'03 Regional Monitoring Study, expanded coverage into the intertidal zone, and incorporated non-POTW or regional monitoring efforts within the acceptable coverage limits.

The sixth (2011), seventh (2012), eighth (2013), ninth (2014), tenth (2015), eleventh (2016), twelfth (2018), thirteenth (2021) and current edition continued the coverage expansions begun earlier, filling in increasing numbers of species from embayment and rocky and sandy intertidal sampling. Described species and most provisional species added during the B'08, and B'13 and B'18 regional monitoring surveys are included. Continued changes to higher classification from ongoing molecular and combined molecular/morphological based phyletic re-examinations were incorporated. Edition 6 was the first to benefit from the Species List Review Committee (SLRC) which is comprised of SCAMIT members, most of whom are actively involved in the identification and enumeration of marine invertebrates in the SCB. Their efforts, as editors and contributors, have increased the effectiveness of the review and have continued in preparation of subsequent editions.

CONVENTIONS

Arrangement of the list is hierarchical. The categories used are phylum, subphylum, superclass, class, subclass, infraclass, superorder, order, suborder, infraorder, superfamily, family, subfamily, tribe, genus (subgenus), and species. For ease of use each taxonomic category is offset from the next higher category. Each category above genus is, moreover, indicated directly by inclusion with the taxon name itself to avoid ambiguity, e.g., Subphylum Echinzoa. Arrangement of all taxonomic levels is phylogenetic when information is available and alphabetic otherwise. Authorship is attributed in conformance with International Code of Zoological Nomenclature (ICZN) rules (Ride 1999). The listing of genus-level identifications, e.g., *Bimeria* sp represents the degree to which the identities of these taxa are known in the region. This form is also used in cases where the only specimens representing the genus were indeterminable due to absence of diagnostic characters. It is regional practice in monitoring programs to identify some groups of organisms at family or higher taxonomic level. An example is misophriiid copepods which are recorded at the ordinal level or the Phylum Nematoda which is recorded at the phylum level. For these taxa there will not be any child taxa displayed on the list. The level at which they are typically reported is indicated by the lowest level taxon provided in the hierarchy.

The degree of detail in the use of higher taxonomic categories varies between groups. In groups where there are both large numbers of species and wide variations in form, numerous categories are listed between the phylum and genus level (arthropods, for example). In poorly represented groups with few species, e.g., cephalochordates, there may be fewer categories listed between phylum and family.

Within the list the following typographic conventions have been employed:

PHYLUM LEVEL IS ALL CAPS

Family, Subfamily and Tribe levels are bolded

Genus and species are in italics

Synonyms are indented below currently accepted binomens and not italicized

Three hundred twenty unpublished provisional species names recognized by SCAMIT are included in the list. These names are applied to organisms suspected of being new species or whose identities cannot be determined from available literature. Provisional names are typically in the form of a genus name followed by the word species (abbreviated as sp) and an alphabetic, alphanumeric, or numeric designator. In provisional binomens, the generic level name is italicized, while the specific name is not. Synonyms are left unitalicized to help clarify their status. In cases where the allocation of a taxon is uncertain, the levels at which uncertainty exists are indicated, e.g., family uncertain, suborder uncertain, etc. Ideally, a provisional name is provided as a temporary designation pending resolution of the organism's identity through further research or publication. In practice, many have become long standing, stable, and widely recognized taxa names within the region. Some are published, and this is reflected in their authorship. Of the 320 SCAMIT provisional taxa included in this edition, some date back to the 1970s. Many of the provisional taxa recognized by SCAMIT member taxonomists have now been described either by the members themselves or by other taxonomists. You will find them on this list as synonyms of formally described taxa. All listed provisionals have been subject to examination and their descriptions distributed through the activities of SCAMIT (1982 to present) or its antecedent, the SCCWRP Taxonomic Standardization Program (1973-1980). For these reasons, and because they represent a substantial proportion (11%) of the listed taxa, these provisional species names are included in the list. The unpublished provisional names are distinguished from formally erected species and provisional names published in the literature by the symbol § following the author. Authorship is attributed for provisional names to tie them to specific diagnoses. Attribution of authorship of these unpublished names *does not* follow a rule of priority but attempts to indicate the most recent and/or complete source of information regarding the species. The date provided represents the date of distribution of diagnoses or descriptions. Provisional species names for which there is no regional recognition or available diagnoses are not included. These are numerous, and

usually become provisional names whose usage is regionally standardized as voucher sheets on them are distributed. The rules for inclusion of provisional taxa are outlined in Volume 39, Issue 6, of the SCAMIT Newsletter (2022). The SCAMIT Provisional Voucher Sheet Guidelines can also be found at SCAMIT.org under Tools.

Four conditional designations are used in the list. The terms conferre and near (abbreviated cf and nr, respectively) inserted in the binomen indicates that the organism closely resembles the nominal species but its actual identity is in question. The term affinity (aff.) inserted in the binomen is defined as having affinity with but not identical to the nominal species. The term complex (abbreviated Cmplx) appended to a name indicates that the listed taxon is recognized as having a high degree of poorly defined variability and may belong to an incompletely discriminated group of species.

The first entry in the synonymy is the name as originally described (basionym) if it differs from that listed as currently used. Otherwise, entries are in alphabetical order. The form in which authorship is provided is used to distinguish the nature of the entries. Examples of the forms used, and their meaning are provided below.

Schmitt 1921	Synonym
Schmitt 1921 in part	Partial synonymy
of Holmes 1900	Variant generic placement or orthography
of Schmitt 1921 not Blazor 1899	Specific instance of incorrect usage
of authors not Bates 1885	Incorrect usage by several authors
of authors SCB not Baird 1863	Incorrect usage, regionally, by several authors

Usage cited as “of authors” is not restricted to usage in the literature, but also includes usage in survey results and reports. The acronyms NEP stand for Northeast Pacific.

Each new edition in the past has had name changes and new entries from the previous edition. These modifications were not listed or noted prior to Edition 5, making them hard to find for taxonomists and database managers who were concerned with updating species lists. In this edition all changes, other than deletions (see Appendix for deletions), from the previous edition are noted in red colored font. This will make finding and noting changes much easier. Rules were established for red color font. The rules highlight the changes to previous edition that taxonomists and database managers should be aware of when reporting binomials, authors, or hierarchical position of taxa.

- New name not in previous edition (upper hierarchical addition, new species addition either as valid name or synonym).
- Change in status of synonym, elevation to valid name.
- Change in status of valid name, placed in synonymy.
- Spelling correction, red font indicates the changed name either genus or species (not the entire binomen) or author.
- Correction to authorship attribution.
- Change in assigned genus.
- Change in placement within the hierarchy.

For this edition the SLRC conducted a complete review of all provisional taxa listed in the previous edition. See Appendix for complete listing of taxa removed including explanations for their removal.

AUTHORITY LIST FOR TAXONOMIC INFORMATION

A broad range of sources was used in construction of this hierarchical listing of organisms. The overall basis is that embodied in Austin's (1985) *An Annotated Checklist of Marine Invertebrates in the Cold Temperate Northeast Pacific*. This classification has been superseded in a number of areas by investigations

over the past quarter century which aimed to put animal classification on a more phylogenetic basis. These investigations initially used cladistic methods to reassess relationships based on morphological characters. More recent contributions typically utilize molecular data. Use of the weight of evidence approach, which combines molecular, morphological, paleontological, and developmental lines of evidence, has become increasingly common. These investigations are ongoing, and much uncertainty remains for many groups. A recent synthesis by (Cracraft & Donoghue (2004), while still imperfect, can serve as a consensus base for updating the hierarchical relationships used by Austin (op. cit.). Where groups have been revised at higher level based on phylogenetic information in Cracraft & Donoghue (op. cit.), it is so indicated under each group below.

The formation of superfamily names follows recommendation 29A of the ICZN (Ride 1999). With this exception and those listed below, all classifications above genus-level are derived from Austin (op. cit.). Genus-level taxa names and the distribution of species among genera are derived from multiple sources in the recent literature. The degree of congruence of this list with the World Register of Marine Species (WoRMS) (www.marinespecies.org) is checked and differences are resolved on a case-by-case basis by the SLRC. Differences in this list from the treatment in WoRMS are intentional and reflect the position of SCAMIT on issues in dispute within the taxonomic community.

Phylum Porifera

Division of the sponges into two phyla, Silicea and Calcarea, used in the last edition was changed in this edition. The hypothesis of polyphyly was rejected in favor of monophyly, based on a number of molecular studies, e.g., Laumer *et al.* (2019). The system used herein is that of Hooper and van Soest (2002) who recently and massively treated the phylum. Exceptions to this are based on Lee *et al.* (2007).

Recent molecular studies have shown the orders within the Hexasterophora to be paraphyletic. The new taxonomic assignments of the families contained within the Hexasterophora follow that of Dohrmann *et al.* (2017).

Recent molecular studies have shown the Class Demospongiae to be paraphyletic. The new taxonomic assignments of the families contained within the Demospongiae follow that of Morrow & Cárdenas (2015).

Use of subfamilial names in Geodiidae follows Cárdenas *et al.* (2010).

Organization of the Tethyida follows Turner (2020).

Phylum Cnidaria

Higher level classification of Cnidaria based on McFadden *et al.* (2022) and Stampar *et al.* (2014).

Family organization within the Cnidaria alphabetical.

Modifications follow Cairns *et al.* (2002.) unless otherwise indicated.

Placement of Oplorhiza in Campanulinidae follows Hochberg & Ljubenkov (1998).

Placement of species not recorded by Austin (op. cit.) follows Ljubenkov (1980).

Most cases which vary from Cairns *et al.* (op. cit.) are based on information in either the World Hexacorallian Database

(<http://hercules.kgs.ku.edu/hexacoral/anemone2/index.cfm>) or the

World Hydrozoan Database (<http://www.marinespecies.org/hydrozoa/>).

Phylum Platyhelminthes

Developments in the understanding of this group have been numerous and far-reaching. The traditional Phylum Platyhelminthes as used by Austin (op. cit.) has been modified to exclude the Acoela, which with the Nemertodermatida form the Acelomorpha, now considered the sister taxon to all other bilaterians (see Eernisse & Peterson (2004) and Littlewood *et al.* (2004)). No acoels have yet been taken by surveys within the SCB, and so this change is not reflected in the listing. Other high-level changes within this phylum do require some modifications of the hierarchy as used in Austin (op. cit.) but are also only needed for forms not yet reported on the list. Prior to this Edition, the classification of the Polycladida generally follows Faubel (1983, 1984), with some input from Prudhoe (1985). The recent application of innovative methodological approaches (e.g., molecular phylogenies, DNA sequencing, fluorescence microscopy and immunocytochemistry) has created changes in both the Acotylea and Cotylea. Multiple lines of evidence now support three acotylean superfamilies and a cotylean classification based on families (Dittman *et al.* 2019, Litvaitis *et al.* 2019, Oya & Kajihara 2020).

Phylum Nemertea

Higher classification within Phylum Nemertea follows Strand *et al.* (2018).

Phylum Mollusca

The Class Aplacophora as used by Austin (op. cit.) has been suggested to be paraphyletic (see Salvini-Plawen & Steiner (1996) and; Haszprunar (2000), although there is still not complete agreement on the issue (see Scheltema (1996) for a dissenting opinion). The paraphyly seems clear, although just how the Solenogastres and Caudofoveata are related to the Polyplacophora is not (see discussions in Salvini-Plawen 2003; Lindberg *et al.* 2004). A series of recent investigations utilizing molecular, paleontological, anatomical, and developmental data have now clearly defined the Subphylum Aculifera, which includes the Classes Polyplacophora, Solenogastres, and Caudofoveata (Sigwart & Sutton 2007; Kocot *et al.* 2011; Faller *et al.* 2012; Sutton *et al.* 2012; Vinther *et al.* 2012; Kocot 2013; Scherholz *et al.* 2013; Telford 2013). Superorders Aplotegmentaria and Pachytegmentaria along with Order Cavibelonia were found by Kocot *et al.* (2019) to be polyphyletic and are removed here.

Nomenclature within the chitons follows Stebbins & Eernisse (2009) where it differs from Austin (op. cit.).

Placement of Class Monoplacophora in the Subphylum Conchifera follows Hazprunar *et al.* (2008).

Year of publication for taxa erected by Reeve, the Sowerbys, and Gray follows Petit (2007, 2009, 2012).

Year of publication for taxa erected by P. P. Carpenter between 1864 and 1866 follows Palmer (1958).

General classification of the Gastropoda follows Bouchet *et al.* (2017) with most changes cross-referenced with WoRMS.

Insertion of Subfamily Zonariinae within Family Cypraeidae is after Groves (2019).

Higher classification for Superfamily Olivoidea is after Kantor *et al.* (2017).

Placement of Family Ptychatractidae in Superfamily Turbinelloidea is after WoRMS.

Classification of the vetigastropod Families Scissurellidae and Anatomidae follows Geiger (2012).

Classification of the vetigastropod Superfamily Trochoidea follows Williams *et al.* (2008) and Williams (2012).

Nomenclature embodied in McLean (2007) was incorporated unless superseded by more recent work, for instance, the molecularly-based phylogeny of the Nassariidae reported by Galindo *et al.* (2016).

Within the Superfamily Buccinoidea the addition of the Family Austrosiphonidae for the genus *Kelletia*, the application of Family Busyconidae (Subfamily Busycotypinae) to the genus *Busycotypus* and the change to Subfamily Netuneinea within the Family Buccinidae for the genus *Neptunea* follow Kantor *et al.* (2021).

Elevation of Cysticinae to family rank and inclusion of Subfamily Plesiocysticinae follows Covert & Covert (1995). The resurrection of Subfamily Cysticinae within Family Cysticidae follows Bouchet *et al.* (2017).

Allocation of genera to families within the Superfamily Conoidea follows Bouchet *et al.* (2011). Phylogenetic arrangement of the families within the superfamily follows Puillandre *et al.* (2011) and is based on their 3 gene-derived phylogeny.

General structure of the heterobranch clades follows Kocot *et al.* (2013), Bouchet *et al.* (2017) and Brenzinger *et al.* (2021) in particular the placement of the Nudipleura within the infraclass Euthyneura and the inclusion of the infraclass Mesoneura.

Placement of *Iselica* in Amathinidae follows Turgeon *et al.* (1998).

Organization of the Cephalaspidea follows Valdés (2019).

The taxa included in Superfamilies Flabellinoidea, Aeolidioidea and Fionoidea are reorganized and new families and genera introduced based on the analyses of Korshunova *et al.* (2017 a,b).

Placement of *Pleurobranchaea* in Pleurobranchaeidae follows Behrens (2004).

Organization of order Sacoglossa follows Jensen (2007).

General structure of the heterobranch clades follows Kocot *et al.* (2013) and Bouchet *et al.* (2017), in particular the replacement of the Nudipleura with the infraclass Euthyneura.

Placement of *Iselica* in Amathinidae follows Turgeon *et al.* (1998).

Organization of the Cephalaspidea follows Valdes (2019).

Order of heterobranch clades not included in Kocot *et al.* (2013) follows Oskars *et al.* (2015).

The taxa included in Superfamilies Flabellinoidea, Aeolidioidea, and Fionoidea are reorganized and new families and genera introduced based on the analyses of Korshuanova *et al.* (2017a, b).

Placement of *Pleurobranchaea* in Pleurobranchaeidae follows Behrens (2004).

Within the Order Euthyneura, superfamily-level taxa are from Abbott (1974); allocation of genera among families follows Behrens (2004).

Organization of order Sacoglossa follows Jensen 2007

Classification of the Bivalvia follows Coan, *et al.* (2000), with modifications based on Taylor *et al.* (2007), Valentich-Scott & Skoglund (2010), Bieler *et al.* (2010), Oliver & Taylor (2012), Sharma *et al.* (2012), Bieler *et al.* (2014) and Lemer *et al.* (2019).

Innovations to both individual species, generic, familial, and higher classifications by Coan & Valentich-Scott (2012) and Valentich-Scott, Coan & Zelaya *et al.* (2020) are included throughout the Bivalvia.

Substitution of Subfamily Codakiinae for Myrteinae after Taylor *et al.* (2016).

Scaphopoda Generic and family allocations, including subfamily divisions within Family Gadilidae, follow Steiner & Kabat (2001).

Formulation of higher taxa names within cephalopods follows Sweeney & Roper (2000), as modified by Nishiguchi & Mapes (2008).

Phylum Annelida

Classification of the Class Polychaeta follows Rouse & Fauchald (1997) and Rouse & Pleijel (2001).

Inclusion of Echiura as a subclass of Polychaeta with Order Echiuridea and Suborders Bonelloinea, Echiuroinea, and Xenopneusta follows Margulis & Schwartz (1998).

Inclusion of Order Sipuncula within the Polychaeta and the higher order classification within the order follows Schulze *et al.* (2017) and Schulze and Kawauchi (2021).

Revival of Subclasses Errantia and Sedentaria follows Struck (2011).

Use of Amphinomidae follows Borda *et al.* (2015).

Use of Infraclasses Canalipalpata and Scolecida follows Zrzavý *et al.* (2009).

Placement of *Travisia* within the Travisidae follows Blake & Maciolek (2010).

Use of Acoetidae instead of Polyodontidae follows Pettibone (1989).

Use of Pholoididae instead of Pholididae follows Pettibone (1984).

Placement of Pholoididae and Pisionidae in Sigalionidae follows Norlinder *et al.* (2012). The inclusion of subfamilies follows Gonzalez *et al.* (2018).

Use of Pilargidae instead of Pilariidae follows Licher (1994).

Revisions within the Syllidae follow San Martín (2003), Böggeman & Westheide (2004), Aguado & San Martín (2009), Lattig & Martin (2009), San Martín *et al.* (2009), and Aguado *et al.* (2012).

Nomenclature within the Glyceridae follows the revision of Böggemann (2002), with exceptions.

Nomenclature within the Goniadidae follows the revision of Böggemann (2005), with exceptions.

Use of Hesionidae follows Pleijel *et al.* (2012)

Use of Microphthalmidae follows Salazar-Vallejo *et al.* (2019)

Use of Nereididae instead of Nereidae follows Pettibone (1971).

Use of Oenonidae instead of Arabellidae follows Orensanz (1990).

Use of Onuphidae follows Paxton (1986).

Inclusion of the Siboglinidae in the Sabellida follows Rouse & Pleijel (2001).

Elevation of Fabriciinae to Fabriciidae follows Huang *et al.* (2011).

Placement of *Raricirrus* in Ctenodrilidae follows Petersen & George (1991).

Generic changes within the Flabelligeridae follows Salazar-Vallejo (2007, 2012, 2014).

Generic changes within the Sternaspidae follows Salazar-Vallejo & Buzhinskaya (2013).

Placement of *Artacamella* in Trichobranchidae follows Holthe (1977).

Use of Longosomatidae instead of Heterospionidae follows Borowski (1995).

Use of Tubificidae instead of Naididae follows Erseus & Gustavsson (2002).

Use of Terebellinae instead of Amphitritinae follows McHugh (1995).

Arrangements of subfamily assignments within the Polychaeta follow:

Ampharetidae — Fauchald (1977).

Maldanidae — Fauchald (1977).

Nereididae — Fitzhugh (1987).

Phyllodocidae — Pleijel (1991).

Polynoidae — Salazar-Silva (2006).

Serpulidae — Kupriyanova *et al.* (2023).

Syllidae — Aguado *et al.* (2012).

Terebellidae — Fauchald (1977).

Phylum Arthropoda

Subphylum taxa are from Brusca & Brusca (2003).

Arrangement and nomenclature within the Pycnogonida follow Bamber (2007).

The organization of the Subphylum Crustacea follows the revised structure presented in Oakley *et al.* (2013). Organization within the subphylum is phyletic rather than alphabetic and follows their phylogeny.

Classification of the Copepoda follows Ahyong *et al.* (2011).

Mysid subfamily arrangement follows the cladistic analysis of Meland & Willassen (2007).

Taxonomy of the cumacean family Lampropidae follows Gerken (2018).

Higher classification of the Order Amphipoda based on Lowry & Myers (2013, 2017), or Bousfield (2001).

Allocations of taxa and systematic arrangements within the Amphipoda follow Lowry & Myers (2017).

Transfer of local lysianassoids formerly placed in Uristidae to Tryphosidae follows Lowry & Kilgallen (2014).

Subordinal and superfamilial taxa in Isopoda follow Brandt & Poore (2003).

Family allocations in Anthuridea follow Poore (2001).

Family allocations in the Tanaidacea follow Larson & Wilson (2002).

Nomenclature within the Order Decapoda follows De Grave *et al.* (2009), with galatheoids after Ahyong *et al.* (2010).

Family allocations within the Hippolytoidea follow De Grave *et al.* (2014).

Phylum Kinorhyncha

No exceptions.

Phylum Echinodermata

Differences in classification above family are from Maluf (1988), or Kroh & Smith (2010).

Arrangement of Ophiuroidea follows suggestions of O'Hara *et al.* (2018).

Phylum Phoronida

No exceptions.

Phylum Brachiopoda

Classification of the phylum follows Williams *et al.* (1996).

Phylum Entoprocta

No exceptions.

Phylum Bryozoa

General classification of the phylum follows Hausdorf *et al.* (2010).

Within cheilostomes the analysis of Knight *et al.* (2011) was followed.

Use of Annectocymidae instead of Diaperoeciidae follows Soule *et al.* (1996). Retention of *Diaperiformia* there does not follow WoRMS.

Use of Candidae instead of Scrupocellariidae follows Soule *et al.* (1996).

Placement of *Cauloramphus* in Calloporidae follows Soule *et al.* (1996).

Placement of *Celleporaria* in Celloporariidae follows Soule *et al.* (1996).

Phylum Chordata

The adoption of Subclass Tunicata over Urochordata follows Margulis & Schwartz (1998)

ACKNOWLEDGEMENTS

The editors would like to thank the members of the SLRC and the large number of SCAMIT members who have devoted their time to the origination and maintenance of this taxonomic listing. Comments from non-SCAMIT members have also been received and are always welcome. The application of many sets of eyes to this list has helped eliminate many errors during its development. While this edition, like previous ones, will undoubtedly have errors, these are the responsibility of the editors alone.
