

Imaged specimen from:  
ITP I-6 rep.1 2July2001 83 ft.

**Pigment on the prostomium fades in preserved specimens. Many specimens retain visible pigment only as stripes along the ventro-lateral groove between the peristomial wings and the first setiger. Notice the darkest pigment on the ventrum of the image at the top right.**

**Specimen at right is alcian blue stained to highlight the reduced first branchiae on the first setiger.**
