

SCAMIT Codes: LACO 47, PL 58

Date examined: March 3, 1985
Voucher by: Karen Green (MEC)

Literature:

Arwidsson, 1907
Fauvel, 1914
Green, 1984

Diagnostic characters:

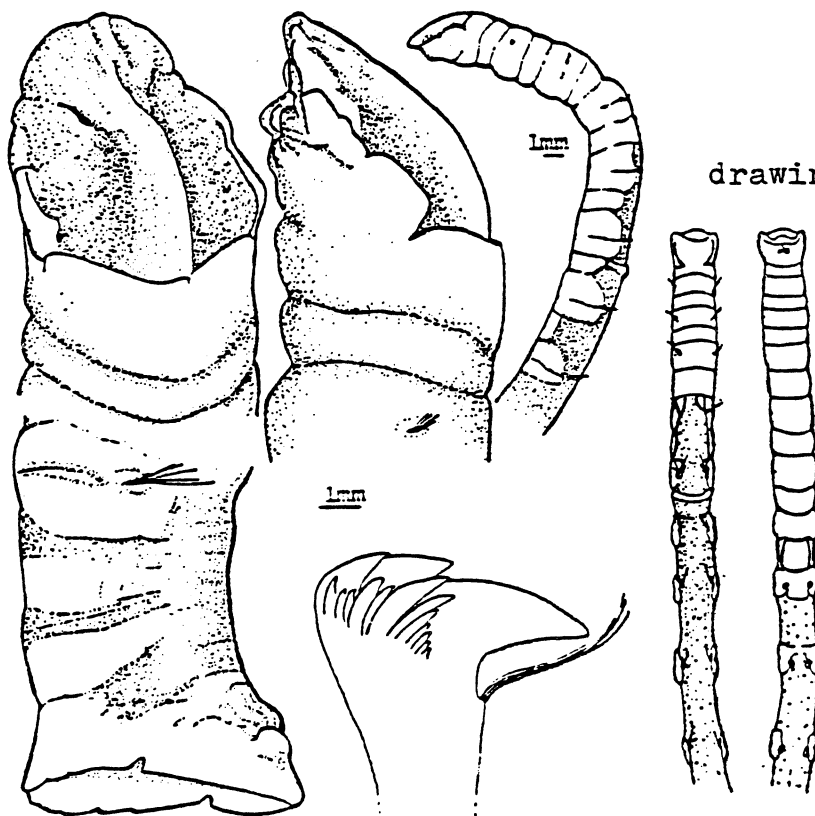

1. 19 setigerous segments, 2 asetous preanal glandular pads.
2. Cephalic plaque with smooth lateral and posterior margins. Posterior margin forms deep pocket. Prostomial palpode semi-triangular, keel long and high, and nuchal organs short and gently curved.
3. Anal plaque divided into two reduced lobes; dorsal margin smooth, ventral margin smooth to crenulate.
4. Dorsal glandular band behind glandular tori of setiger 5.

Additional notes:

The syntype of Maldane cristata and type material of M. sarsi were examined and are equivalent; records of M. glebifex from the eastern Pacific are questionable (Green, 1984; unpublished thesis).

Distribution:

Alaska south to Antarctica, Japan, Arctic Ocean, Baffin Bay, Davis Strait, and Skagerrak. Depths from 3 to 3034 m.
