

VOUCHER SHEET

Haminoea virescens (Sowerby, 1833)

Haminoediae

---

Important Characters:

The exposed shell is opaque white to pale green. Differs from Gould's paper bubble in that the aperture is larger than half the length of the shell and the spire is sunken.

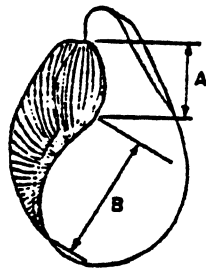

The body is green, and there are yellow dots on the head shield and yellow and white mottlings on the parapodia.

Size: To 18 mm.

Comments:

Natural History: A rocky open coast species, it sometimes occurs in bays.

Range: Alaska to Panama.

Shell of Haminoea virescens
